

## ATTACHING THE CHUTE

It is easy to use PowerLift to handle the chute if you keep a wide stance throughout the entire job. To lift the chute, step up close to it and let it rest on your chest as the legs do the lift. Resting it on your chest keeps it close transferring the weight off of your back and onto your legs. With the chute on your shoulder, walk up to the attach point and before you bend down to attach it, step into another wide stance. This entire job can be done with your legs using PowerLift in order to keep the load off of your back.
