

LIFTING LARGER COILS FROM THE PALLET

Lifting large coils off a pallet can be a problem just because of their size. But the job can be made quite a bit easier if you use a **POWERLIFT[®] Tip-the-Load**. To make it easy, stand at the corner of the pallet in a wide stance, knees bent. Then before you lift the coil, tip it up and towards you to bring it up to you. Then if possible, turn the coil toward your thigh and let it rest there as you move away from the pallet with the coil in hand. If you can't rest the coil on your thigh, you will still have made the job easier by using your legs and not your back. Always, be safe and use **POWERLIFT[®]**
