

Several techniques can be used when either placing or removing product from the cages.

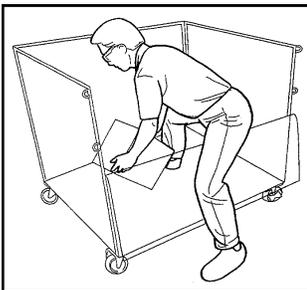

Approach the front of the cage at a 90 degree angle and with a wide stance, use POWERLIFT<sup>®</sup> to lift the load.

Use the lean pad on the front of the cage to create a Lean Bar Technique for handling the load. Just make sure the wheels are blocked so the cage can't move.

Use a Golfer's Bend if you are lifting with one hand and bridge to the cage with your other hand for an easy lift.

Step into the cage, if possible, to get close to the load and create a wide stance. Make sure the cage cannot move if you use this method.
