

OPENING A #9 FIBER VAULT LID

This job requires the use of a screw driver and a hook to loosen up the lid, and so requires you to get all the way down to the ground with your hands to do the work. Going down to the ground works best with one knee on the ground in a Tripod position. This makes it easier to work on the lid without working your back. Once you are ready to pull the lid with the hook, stand in a wide stance at the corner of the lid and pull with your legs. This entire job can be done with your legs if you make up your mind, that is what you want to do!
