

LIFTING BATTERIES FROM THE RACK—LOW SHELVES

Lifting heavy batteries from the lower shelves of a rack is a perfect job for POWERLIFT®. The key to using POWERLIFT® for this job is to stand at an angle to the rack with a wide stance. The angle opens up a space for you to move the battery into as you lift. That is important because you want to keep a heavy load like that as close to you as you can. As you lift the battery and begin to move it towards the cart, make sure you move your feet and create another wide stance as you sit it down. This is using POWERLIFT® and will protect your back and keep you being able to do your job!
